7 Assuming a set of documents that need to be classified, use naive Bayesian classifier model to perform this task Built in java class / API can be used to write the program calculate the accuracy precision & recall of your dataset.

```
import pandas as pd
msg = pd.read_csv('c:/users/lenovo/
    Desktop/4MT16CS060-Prajwal/
    lab6.csv')names=['message','label'])
print('Total instances in the dataset:'
                msg.shape[0])
msg['labelnum'] = msg.label.map
        ({'pos':1,'neg':0})
X = msg.message
y = msg.labelnum
print("\n The message & its label
    of first 5 instances are listed
                below")
X5, y5 = X[0:5], msg.label[0:5]
for x,y in zip(X5,y5):
    print(x,',',y)
```

output :

Total instances in the dataset = : 18
The message & its label of first 5 insta
are listed below

I love this sandwich, pos
This is an amazing place, pos
I feel very good about these beers, pos
This is my best work, pos
what an awsome view, pos

Dataset is split into Training & Testing Sets
Total training Instances : 13
Total testing Instances : 5

Total features extracted using countvectorizer:
46

Features for first 5 training instances are listed
